Foreign control and lobbying: full-inventory checkpoint

This is an expanded acquisition and source-review checkpoint, not a completed investigation or a validated Jev ranking. No concealment finding is established. The wider screen has produced a new historical document inconsistency worth investigating, several explicit disclosures, and important warnings about relying on database fields.

What the wider screen adds

The user-supplied DOJ exports contain 17,765 principal relationships, 7,090 registrant rows and 154,309 document rows. All principal rows were screened against all five official House 2025 XML archives: **109,389 original XML records, 23,776 client-name strings and 28,341 House relationship identifiers**. The matching rules generated 598 discovery edges, including 520 for representations that ended before 2025. Historical representations remain relevant discovery leads; their termination does not establish that ownership ended. Corporate suffix removal can match different legal entities, so these are not 598 verified identities.

Thirteen matched relationships have at least $1 million in 2025 reported income or expenses. All thirteen complete API histories have now been acquired: **981 forms**. Two additional Gotion outside-firm histories bring the reviewed history set to **1,009 original forms**. All **66 acquired 2025 quarterly amount pairs** independently parsed from original HTML agree with the API, with no posting-date ties. The latest-posted quarter totals reproduce the archive screen's thirteen major totals. These totals measure reported lobbying activity, not foreign funding. Outside income is never added to a client's in-house expenses.

The sixty new-US-address FARA principal name queries are an earlier, completed subcohort, not the boundary of this full screen. It recovered Futurewei and Qatar filings with explicit disclosures and rejected the Global AI/AIDS-organization name collision. reverse-query-coverage.json and followup-coverage.json preserve that work.

Investigation priority, not a legal risk score

1. **TransCanada PipeLines Limited: a historical No response and contemporary parent disclosure.** Its original registration, section 14, filed 16 December 2010 and effective 5 November, answers No. It expressly gives a Calgary, Canada address and describes US/Canada natural-gas and climate-legislation lobbying, so Canadian identity is not hidden. The issuer's 2009 annual information form, physical pages 4 and 22, identifies the same address, the 2003 arrangement and TransCanada Corporation's ownership of all common shares. Its 2010 annual financial report, physical page 96, Note 1, calls TCPL a wholly owned subsidiary of that parent. These bracket the registration, but are not a certified daily share register. The 2025 relationship reports $2.72 million in expenses; that establishes present cohort materiality, not the size of the 2010 campaign. The strongest innocent explanation is filing interpretation/error or a separate disclosure not yet reconciled, especially given the openly Canadian registrant. The decisive missing records are the contemporaneous complete registration context, ownership effective at the filing, and the inaccessible historical FARA Exhibit. This is a sourced inconsistency for review, not intentional concealment.

2. **Honda: exact employer identity and a historical amendment need reconciliation.** The current API label is American Honda Motor Co., Inc.; the 20 April 2012 original amendment actually names Honda North America and answers No at section 14. It describes greenhouse-gas/CARB work. Honda Motor Co., Ltd.'s 2012 Form 20-F, printed page 25, Organizational Structure lists Honda North America, Inc. and American Honda Motor Co., Inc. separately, each at 100% ownership/voting interest as of 31 March 2012. This supports a parent-ownership question but does not license substituting one subsidiary for another. The current relationship reports $3,763,079 in 2025 expenses. Its FARA name match refers to American Honda in 1990, not

necessarily the 2012 printed client. Strong alternative: amendments, employer changes or separate registrations explain the apparent inconsistency. Missing: the initial registration, exact legal-entity/employer continuity, contemporary amendment instructions and an original historical FARA filing. Do not call the 2012 document a 2025 nondisclosure.

3. **Novartis: historical No responses, unresolved exact legal client.** The 2003 amendment, physical page 3, visually checks No; the 2011 amendment does likewise. Both print “Novartis,” insufficient to establish whether the client is the Swiss parent, a US subsidiary or a consolidated office. The issuer's 2010 annual report, physical page 250, lists several separately named US subsidiaries at 100%; it does not resolve the bare LDA name. Current relationship expenses are $7.788 million. A different legal-client identity is the strongest innocent explanation. Missing: original initial registration, exact employing entity and the inaccessible 1997 Ruder Finn Exhibit A. Remains an identity lead, not a documented ownership omission.

4. **Gotion: major activity, but explicit foreign-ownership disclosure.** The in-house registration, Mercury registration and Vogel registration all answer Yes and name a Chinese parent at 100%. The Warner Norcross FARA Exhibit A, physical page 2, expressly names Hefei Gotion High-Tech Power Energy Co., Ltd.; the contract concerns a Michigan battery-components project. The termination amendment, physical page 1, confirms termination on 1 April 2025. The issuer's 2024 annual report, physical pages 321–323, supports a parent/intermediary structure, with the translated US-subsidiary alias still unresolved. The immediate-versus-ultimate parent naming needs chain-completeness review; it does not show that foreign ownership was hidden. In-house 2025 expenses are $2,459,072. Mercury income is $910,000 and Vogel income $665,000, reported separately because outside fees may already be included in expenses. This is counterevidence to a concealment allegation, not certification that every field was complete.

These priorities are editorial follow-up order. The previous PPD, Arm and KuCoin dossiers remain in the earlier expansion report, with their identity, corrected-amount and ownership-date limitations intact. Jev's failed legal calibration is not overcome by collecting more documents; no new legal score is presented.

Remaining major relationships

Relationship	2025 original-form total	Observed evidence and remaining limit
Bayer Corporation, consolidated	$9,200,000 expenses	113 forms acquired; no RR/RA or foreign-entity event returned. This is a registration gap, not a No response. FARA names Bayer AG, a different nominal entity.
Novo Nordisk Inc.	$7,230,000 expenses	93 forms; original 2004 registration and amendment visually answer Yes, name Novo Nordisk A/S and report zero contribution. Later originals disclose the ownership chain. Historical FARA principal is Novo Nordisk A/S.

Relationship	2025 original-form total	Observed evidence and remaining limit
Siemens Corporation	$3,760,000 expenses	95 forms; no recovered initial registration. FARA names Siemens AG. Exact parent/subsidiary and missing-record review remains.
Nippon Steel / Akin Gump	$3,420,000 income	12 forms; 2024 RR answers No, but the client itself is expressly Japanese. Foreign nationality is not proof of another qualifying owner. Historical FARA records include a chronology inconsistency.
Hyundai Motor Company	$1,960,000 expenses	102 forms; two historical PDFs visually inspected. The 2000 original lists Hyundai under affiliated organizations, not foreign entities; the amendment is Self and answers No. API foreign_entities does not faithfully identify that original section.
Nestle USA	$1,737,352 expenses	95 forms; original 2009–10 quarterly updates expressly list Nestle SA at 100%. Historical FARA identity and current ownership percentages still need date-specific treatment.
Volvo Car Corporation	$1,495,000 expenses	66 forms; 2010 RR answers Yes, naming Volvo Car Corporation at 100%. FARA name is Volvo Car BV; the match is not a proved legal identity or complete ownership chain.
BMW of North America LLC	$1,270,000 expenses	63 forms; original 2011 RR answers Yes, naming BMW AG at 100%. FARA catalog dates are internally inconsistent, not evidence that BMW misfiled.
Cameco Corporation	$1,040,000 expenses	52 forms; 2018 RA answers No and expressly identifies a Canadian registrant/address. No evidence yet of an undisclosed qualifying separate foreign owner.

The original UUIDs, source URLs, full printed event text and exact totals are in major-original-reconciliation.json. Original form bytes are preserved; API fields are labeled as indexing aids. manual-image-review.json records five visual checks. Four regression tests cover real amounts, path integrity, historical client-name changes and the Hyundai metadata/original discrepancy. The six CSV ingestion tests also pass.

Source and legal limits

Ten catalog-derived historical Exhibit A URLs across ten of the twelve historical major leads failed through the public browser reader. The other two, Volvo and BMW, had no Exhibit A rows under the selected registration number. These are access/catalog limits, not proof of absent filings. Gotion's modern Exhibit A and termination amendment were readable through the browser. Direct DOJ PDF transfer remains blocked; no access restriction was bypassed. Browser captures are rendered excerpts, not archived original PDF bytes. Some freely accessible issuer filings were readable through the browser even when direct downloads failed.

The 2010 edition of 2 USC 1603(b)(4) already contains the 20% ownership alternative and separate control/interested-affiliate alternatives. This avoids retroactively importing the 2025 rule into the 2010 question. The printed historical LD-1 forms also state those alternatives. The inflation-adjusted monetary registration thresholds for the newly examined historical years still need a dated primary-source check; statutory unadjusted dollar amounts must not be mistaken for those thresholds. No nonregistration/timing conclusion is drawn from them. The previous report's 2025 LDA/FARA rules and exemptions remain applicable to its 2025 dossiers; historic representation alone is not evidence of a 2025 FARA obligation.

Budget and next actions

No paid calls occurred in this continuation. Across the previous two stages, fifty actual Jev calls have estimated list-rate cost **$0.003035** and an all-call conservative reservation bound of **$0.15**, within the same **$15** authorization. These are not invoice amounts. The prior sixteen-item held-out extraction test comprised eight distinct payloads and eight cache hits, only two distinct real-form payloads; Jev and the code baseline tied. It does not validate legal ranking or demonstrate model advantage. Existing ledgers remain unchanged.

Next, resolve the TransCanada historical registration context and Honda/Novartis legal identities, recover dated historical thresholds/instructions, and review ownership chains rather than promoting No checkboxes directly to accusations. The full-name match does not yet compare every FARA principal against every LDA affiliate/foreign-entity role; that is a deliberate next expansion, with raw name collisions kept distinct from proved entities. Complete the English case-ranking update and readable bundle after these checks. No user action is needed for those independent avenues; inaccessible originals and Library authentication remain documented access limits.
