Foreign control and lobbying disclosure: the broader test

Private research, 7 October 2026. This extends the first checkpoint without changing it.

Coverage correction: the initial ownership flag covered only the 780 high-amount forms. Discovery has now been rerun over all 1,184 annual forms, capturing U.S. Steel's below-threshold quarterly disclosure. Iteration 2 records the correction and systematic domestic-client history extension. The initial expansion had full all-years histories for only 12 of 259 client IDs and zero RR retrievals for 138; neither group was cleared by those gaps. The repair now preserves 3,045 originals and complete all-years histories for 27 IDs; all 138 missing-RR amendment queries completed. FARA inventory work recovered 7,090 active/terminated registrant rows (7,089 registration numbers), but full principal and document inventories remain blocked. Updated scope appears in the coverage files.

The broader search has not established that foreign control behind a major lobbying campaign was concealed. It has produced two concrete ownership-disclosure questions, a major reported engagement whose exact legal client remains unresolved, and several important false positives. Intent is not established in any case.

We started with a reproducible activity screen, not prominent company names: every official LDA API result for reporting year 2025 with a reported amount of at least $1 million. That returned 780 filings attached to 259 client IDs. These are candidate filings, not 780 separate campaigns. A client ID identifies a filing relationship; it is not a universal company identifier. The screen misses campaigns spread across smaller quarterly or multiple-firm reports.

The comparison corpus contains both complete DOJ reports to Congress for 2024. Their 1,598 extracted principal entries include repeated principals and termination annotations. They are historical leads, not a census of 2025 FARA registrations. We followed source-led matches into original Exhibit A/B filings and ownership documents. Download and amendment-reconciliation totals are in the accompanying coverage annex.

Follow-up order

This is an editorial order based on documentary usefulness, not a probability of wrongdoing. New Jev legal rankings are withheld after its earlier negative-control failures.

1. PPD / Mercury: strongest new cross-regime ownership question; the apparent million-dollar filing was corrected.

Mercury's LD-1, section 14, filed 21 February 2025 and effective 15 January, checks No for qualifying foreign entities. Its client is PRVO PLINARSKO DRUTVO d.o.o., at Gospodarska zona Vukovar 13. The missing letter in the LDA spelling is bridged by the address and the legal name in the attached FARA contract, not treated as a different entity merely because of spelling.

Mercury's FARA Exhibit A/B, received 6 May 2025, names Prvo Plinarsko Drustvo (PPD) Group at the same Vukovar address. Physical page 2 marks No to the ownership/control questions and leaves the separate owner-identification response blank. The attached agreement identifies the legal company, d.o.o., on page 10. The audited 2024 company accounts, physical pages 15 and 42, identify Blue Horizon d.o.o. as sole owner at year end. They supply Croatian registry number 030070559 and OIB 58292277611. Page 45 says PPD left the ENNA group in August 2023; ENNA must not be carried forward as its current parent. These are year-end facts reported in June 2025, not a certified daily ownership history.

Further retrieval recovered the 2023 accounts, physical page 44, and 2025 accounts, physical pages 13 and 40. Both again identify Blue Horizon. These snapshots bracket the relevant filings and strengthen the ownership question, while still leaving the exact-day register unverified.

The Q2 original reported $1.2 million. The 23 July amendment reduced it to $120,000. With Q1 $90,000 and Q3 $40,000, the acquired Mercury relationship reports $250,000 plus a Q4 amount below $5,000. The Q4 original checks both no lobbying issue activity and the under-$5,000 income box. A null API amount was not treated as zero.

Strongest alternative explanation: misunderstanding the form's private foreign-owner questions or a filing error, alongside a documented change in service scope. The original agreement concerned commercial energy and trade work; its amendment, effective 15 April, added arranging communications between the Croatian and US administrations and expressly addressed FARA compliance (physical page 20). The later FARA filing therefore does not by itself contradict the earlier LDA engagement. **Decisive missing records:** a certified ownership extract covering the registration dates, any owner-disclosure corrections, and the complete principal-specific FARA amendment history. The acquired record supports a question about identifying Blue Horizon, not concealed government control.

2. Arm Limited / FGS Global: a clearer dated ownership chain, but no acquired FARA counterpart and no million-dollar amount in this relationship after correction.

FGS Global's LD-1, section 14, filed 30 September 2025 and effective 10 September, checks No. It identifies Arm Limited at 110 Fulbourn Road, Cambridge, and lobbying about artificial intelligence and semiconductors.

The original Companies House PSC02, filed 24 August 2023, pages 1–2, identifies company 02557590 and records Arm Holdings Limited, company 11299879, as controlling at least 75% of shares and votes from 21 August 2023. The PSC05 records the parent's change to plc. The 2025 accounts, physical page 79, note 33, identify Arm Holdings plc as immediate parent and Japan's SoftBank Group Corp. as ultimate parent and controlling party. Original image pages were visually inspected; empty PDF text extraction was not taken as missing disclosure.

The Q4 original reported $1.1 million. Its 22 January 2026 amendment reports $110,000. Together with Q3 $100,000, that relationship reports $210,000 for 2025.

Strongest alternative explanation: a filing mistake or confusion between Arm Limited and the publicly traded parent. Publicly available ownership does not establish an intent to hide it. **Decisive missing records:** the exact filing-date share chain and an explanation or correction of the No response. No FARA Exhibit A for this exact client was acquired; the case cannot be described as an established LDA/FARA collision. Relationship totals do not cap other firms' work for the wider Arm group.

A cross-registrant name search found Carmen Group's 2023 Arm Limited registration, which already named SoftBank Group and SoftBank Vision Fund I. That earlier disclosure further weakens any claim of generally hidden ownership; it does not answer why FGS's separate 2025 registration checked No. Carmen's acquired relationship terminated in 2023. The same search also returned Armourshield Limited, which was excluded as a different client.

3. KuCoin / A10 Associates: major reported lobbying, but legal identity and contemporaneous ownership remain unresolved.

The LD-1, filed 12 February 2025 and effective 1 January, identifies KuCoin at 2 Science Park Drive, Singapore, with no corporate suffix or legal registration number. Section 14 checks No. The specific activities include cryptocurrency regulation and congressional work concerning the company's New York attorney general settlement. The Q1 and Q2 originals each report $1 million income. The Q3 termination gives 1 July as termination date, checks no lobbying activity and income below $5,000.

The New York settlement, opening pages distinguishes Mek Global, Phoenixfin and Peken. A 2024 federal indictment, pages 1 and 6–7 also distinguishes multiple KuCoin entities and alleges earlier founder ownership. It is an indictment, not an adjudication or a 2025 share register. DOJ's 27 January 2025 announcement identifies Peken and describes the founders' withdrawal from

management and operations. That does not establish a contemporaneous equity transfer or the identity of A10's contracting client.

Strongest alternative explanation: the brand spans different legal entities and an intervening governance change. **Decisive missing records:** A10's engagement identifying its contracting client, that entity's registration identifier and a dated ownership record. No same-client FARA original was acquired. The reported $2 million is lobbying income, not proof of $2 million foreign funding. The separate criminal proceeding supplies entity clues; it is not evidence of a lobbying-disclosure violation.

What did not survive scrutiny

Alibaba is a group relationship, not a same-client contradiction. The 2016 LDA registration for Alibaba Group Holding Limited already identifies SoftBank at 32%. Its 2025 in-house expense total is $3.36 million after replacing the Q2 report with its amendment. Zeno's 2024 FARA Exhibit A, page 2 explicitly identifies Alibaba Group as parent of Alibaba.com Singapore E-Commerce Private Limited, despite its No checkbox responses. Its February 2025 contract amendment extends a PR engagement. These are distinct clients, registrants and services. The historical LDA shareholder disclosure is not a claim that SoftBank still held 32% in 2025.

A foreign client is not automatically a company with a reportable foreign parent. Nippon Steel and Barrick's No responses need ownership evidence, not nationality-based inference. Nippon's 2025 securities report, physical page 65, lists the largest registered holding at 14.8%, below the 20% equity trigger; nominee holdings are not a complete beneficial-owner analysis. Barrick's 2025 circular, physical page 12, says management knew of no holder controlling 10% of voting rights as of 27 March. Neither source independently settles the alternative control or interested-affiliate tests. No contrary same-client FARA filing was acquired.

The stricter name join produced two historical edges linking Investment Company Institute with Future Investment Initiative Institute. The original names describe different entities. The wider 131-edge token screen also generated matches such as Lockheed Martin with Martin Fayulu and Nippon Steel with All Nippon Airways. All were reviewed as name leads; only Alibaba warranted a group-level follow-up. Rejected names were not sent to Jev as allegations.

What Jev adds—and what it does not

The first checkpoint's model sometimes elevated negative controls and returned logically inconsistent identity and discrepancy judgments. Those results do not support unattended legal ranking. Before further calls, we froze a narrower test: ten previously unsubmitted original section-14 fragments and six new missingness/adversarial controls. Both Jev and an HTML parser scored 16/16 listed items. This represents only **two distinct real-form payloads plus six synthetic controls**; eight results were cache hits. It is not 16 independent real cases or an independently annotated population benchmark.

Jev added no demonstrated accuracy over the parser on this task. It has not been shown to improve the decisive work here: retrieving amendments, resolving legal entities and establishing ownership dates. Passing checkbox extraction does not validate concealment judgments. The expansion therefore reports evidence-based editorial priorities and abstentions, without new model-generated suspicion scores.

Eight new paid calls cost an estimated $0.000177 at the verified input-token rate. Including the first checkpoint's 42 calls, the total under this authorization is **$0.003035**, not an invoice. Reserving the full conservative $0.003 for every one of the 50 calls gives a **$0.15 upper bound**, below the $15 authorization. No other paid service was used. The live test is closed against replay; the ledger is preserved.

The reusable result is an amendment-aware, original-source workflow that reduces false accusations. Its main limit is source coverage, especially a complete contemporary FARA principal/filing index and exact-date ownership records. The budget was not the limiting factor. The first checkpoint's findings and caveats remain separately available; this expansion does not silently replace them.

Scope correction and domestic-client history expansion

Continuation of the checkpoint at f673516593b62e4a96f9c4ba763d7c07244971fd. No new paid calls. The declared history and amendment retrievals are complete; final counts are in the machine-readable coverage files.

The previous foreign_additions_present field was misleadingly named: it described only the initial 780 filings at or above $1 million, not all 1,184 acquired 2025 forms. It is now initial_high_amount_foreign_entities_listed. A separate any_acquired_2025_foreign_entities_listed field uses all annual forms and preserves the supporting filing UUIDs. Neither false value means that an original form checked No or that the client lacks foreign ownership.

The rerun finds five clients with positive foreign-entity entries in the annual forms. Four were already flagged; United States Steel Corporation is newly captured. Its Q3 original, section 27 reports $360,000 expenses and explicitly identifies Nippon Steel Corporation at 100%, with zero contribution. It was excluded from the initial amount-filtered ownership screen solely because it was below $1 million. Its reconciled annual expenses are $2.53 million. This is documented disclosure, not a new concealment allegation, and is now a regression control.

The next selection rule covers every screened US-domiciled client ID with a foreign entity listed in any acquired 2025 form or recovered original RR. It selects 19 relationships, including T-Mobile, U.S. Steel, SK Americas and the pharmaceutical, technology and manufacturing subsidiaries identified by the filings themselves. Four already had complete all-years histories; the other 15 have now been acquired in full, bringing complete all-years histories to 27 of 259 relationships. This extends the earlier focus on seven foreign-country clients without selecting names for their notoriety.

T-Mobile's complete 99-form history supplies a useful counterexample. Its 21 July 2020 amended registration, section 14 explicitly names Deutsche Telekom AG at 43% and SoftBank Corp. at 24%, both with zero contributions; the next quarterly report repeats them. Those original disclosures defeat an inference of nondisclosure from its older RR records or empty 2025 additions. The percentages are historical statements, not independently verified current ownership. Its reconciled 2025 in-house expenses are $11.144 million.

The timeline also recovers Alibaba's 2023 removal of SoftBank, section 28 and SK Americas' 2025 removal of SK E&S, section 28. A current-ownership conclusion cannot simply carry forward every name in the oldest registration.

For the entire US-domiciled missing-RR group, all 138 registration-amendment (RA) queries have completed. They returned 174 forms across 61 relationships, and all 174 originals were acquired. BASF, Shell USA and BAE Systems remain retrieval/history gaps until sources resolve them; a zero RR result never counts as a clean disclosure finding. An RA-only recovery is not equivalent to a complete all-years history. The first expansion had complete histories for only 12 of 259 client IDs and zero RR results for 138. These limits constrain every negative inference.

ownership-timelines.json combines acquired annual forms, RR/RA records and other available histories at relationship level. It records positive disclosures, original HTML section-28 removals, registration responses when actually parsed, superseded quarterly versions and source locators. Filing dates are not ownership-effective dates. It does not turn an empty LD-2 update into a denial, assume an image-based PDF has been parsed, or infer current ownership from an incomplete event stream.

The earlier three case qualifications are unchanged: PPD/Mercury reports $250,000 plus Q4 below $5,000 after amendment; Arm/FGS reports $210,000 after amendment, with earlier Carmen disclosure as counterevidence; KuCoin/A10 reports two $1 million quarters but its contracting legal

entity remains unresolved. No concealment or liability conclusion follows.

The Jev result is **two distinct real-form payloads plus six synthetic controls**, not 16 independent real cases. Sixteen listed test items included eight cache hits. Both Jev and the code baseline were correct on the same eight distinct payloads; this supplies no legal-scoring validation. Legal rankings remain withheld and the combined spending estimate remains $0.003035.

Regression checks cover the actual U.S. Steel below-threshold disclosure, source UUID provenance, duplicate-row handling, RR-positive selection, country scope, missingness and image-PDF abstention. Extended blank table row numbers are excluded from removal events. The correction and selection are committed before completing the new retrieval.

The repaired expansion preserves 3,045 distinct LDA originals. The timeline observes 570 events across 183 relationships, with 13 removal events. It explicitly leaves 322 image-PDF records without structured field interpretation. Acquiring a document is not the same as reviewing every field. The FARA inventory feasibility note separately reports complete rendered registrant responses and blocked full principal/document inventories.

Full FARA inventory: feasibility and actual coverage

The official public interface can enumerate the needed datasets. This executor has recovered the complete rendered active and terminated registrant responses, but has **not acquired the complete foreign-principal or document inventories**. No population-wide collision or concealment claim is supported.

What is acquired

The active registrant endpoint yielded 538 rows and the terminated endpoint yielded 6,552. Together they contain 7,089 distinct registration numbers. Number 5769 occurs twice in the terminated response with different termination dates; neither row was discarded. Current status is not a determination of status on a historical filing date.

The web reader exposes these responses as 68 and 769 indexed lines. Every line was recovered, overlapping lines agreed, and reconstructed JSON parsed successfully. scripts/fara_inventory.py reproduces these checks from saved excerpts. These are rendered text captures with whitespace normalized at line boundaries, **not byte-identical API response archives**. Completeness refers to the two rendered endpoint responses; it has not been independently reconciled to bulk data.

Official complete-data route and blocker

The DOJ bulk-data page documents daily CSV/XML archives covering active and terminated registrants and principals, plus available document URLs. Its verified CSV download links are:

- All registrants

- All foreign principals

- All available document URLs

Each exact URL returned HTTP 403 in the executor on 7 October 2026. The web reader recognized ZIP content but cannot materialize that content type. No ZIP bytes were acquired. Failed requests are in sources/manifest.jsonl; a failed download is not an empty dataset. Repeated requests, alternative credentials, security workarounds and third-party paid services were not used.

The documented API offers registrant lists and per-registration active/terminated principal and document queries, with a five-request/ten-second limit and no authorization requirement. Browser checks of Mercury 6170's principal endpoints in JSON and HTML and its JSON document endpoint failed; Global Point 7518's HTML document list was readable earlier, while its JSON document route failed. Mercury's readable HTML document result was only the first 50 rows. Partial HTML lists are not complete document histories. Broken relative links on the newer friendly documentation route were distinguished from failures of the verified canonical endpoints.

A new-registrants-only query would miss new principals represented by existing registrants and is not an adequate replacement. The full principal inventory remains blocked at the materialization stage. A complete API fallback would require traversing both principal statuses and documents for every registration number and checking every response; it has not been executed or represented as complete. Broad official 2024 reports and selected original filings remain the acquired principal evidence.

Resumption contract

Obtain the three exact official ZIPs through a functioning authorized public download environment and retain their original bytes. scripts/validate_fara_bulk.py DIRECTORY checks CRC, safe uncompressed size, CSV structure, field names, row counts, identifiers and URL counts without silently deduplicating records. Inspect actual schemas before joins. Reconcile active/terminated registration numbers against the saved API snapshot, preserving time differences and duplicate

historical rows. Record publication and retrieval dates separately.

Then enumerate every principal relationship and all document types, including amendments and supplemental statements; preserve the official principal and registration identifiers. Join the declared 259 LDA client relationships to that inventory using legal names, addresses and original contracts, not names alone. Retrieve dated originals incrementally, preserving failed-document denominators. For historical obligation analysis, establish ownership/control and relevant activities on the actual filing date. Keep separate denominators for **inventory coverage**, **original-document acquisition**, **source extraction**, and **legal analysis**. Finding a catalogue row is not reading a filing; reading a filing is not resolving disclosure obligations.

This repair/inventory stage incurred no paid calls. The earlier combined Jev estimate remains $0.003035 and the conservative full-call reservation bound remains $0.15 against the authorized $15 ceiling.

Coverage at this checkpoint

- screen filings: **780**
- screen client ids: **259**
- annual queries complete: **259**
- annual forms: **1184**
- annual ld2 amounts checked: **1171**
- annual ld2 amount pairs matching: **1171**
- rr queries complete: **259**
- rr queries target: **259**
- rr forms recovered: **126**
- rr zero result queries: **138**
- unique catalogued lda filings across all expansion queries: **3045**
- unique original lda forms across expansion: **3045**
- fara report entries: **1598**
- fara report normalized strings not entities: **859**
- strict name edges: **2**
- loose name edges: **131**
- major relationships after amendments: **255**
- new jev actual calls: **8**
- jev test items: **16**
- jev distinct payloads: **8**
- combined pilot cost estimate usd: **0.003035**
- combined full reservation bound usd: **0.15**
- complete all years client histories: **27**
- missing rr ra queries complete: **138**
- missing rr ra queries target: **138**
- missing rr ra forms: **174**
- missing rr ra originals: **174**
- missing rr queries with ra recovery: **61**
- historical image pdf records without structured field parse: **322**
- fara active rendered inventory rows: **538**
- fara terminated rendered inventory rows: **6552**
- fara unique registration numbers: **7089**
- full fara principal inventory acquired: **False**
- full fara document inventory acquired: **False**

RR zero results are retrieval gaps, not evidence of missing registrations. Metadata and original acquisition are counted separately; acquisition does not mean every field was manually read. See REPORT.md and TECHNICAL-ANNEX.md for scope and exclusions.

Technical and coverage annex

Cohort and limits

Acquired 7 October 2026. The initial LDA query was filing_year=2025&filing_amount_reported_min=1000000&page_size=25. All 32 pages returned 780 unique filings and 259 distinct client IDs. Every one of those IDs then received an unfiltered-amount 2025 history query, following all next links: 1,184 unique forms, including 1,171 quarterly reports and 13 registration/amendment forms. All 1,184 original HTML forms were readable. Independent extraction of original LD-2 sections 12/13 matched all 1,171 API amount pairs, with no parse failures.

Latest-posted reports replace earlier versions within client ID, registrant ID, reporting year and quarter. There were no same-timestamp ties. The resulting 1,030 relationship-quarter records cover 259 relationships. Ninety-five initially high filings were superseded; eight latest versions were below the initial numeric threshold or null. The reported annual numeric lower bound still reaches $1 million for 255 relationships. Four do not: RSL Investment Corporation, National Association of Community Health Centers, Arm Limited and PPD. Unknown values remain unknown; original checkbox bounds are retained separately. This is not an audited spending census, and no dollar total is equated with foreign funding.

The systematic foreign-client screen found seven non-US client-country entries: Nippon Steel, KuCoin, PPD, Barrick, Tencent, Alibaba and Arm. Twelve selected client-ID histories contain 505 original forms across all returned years; selection includes those seven, existing foreign-owner disclosures and the stricter name-join candidate. Separate all-years name queries returned 14 Arm-related forms, eight PRVO forms and four KuCoin forms. The Arm query included three distinct client relationships, one of which was the unrelated Armourshield. The exact Arm Limited relationships were inspected separately. Name-query coverage is not coverage of every possible alias or group subsidiary.

The RR census completed all 259 original-registration queries and recovered 126 forms; 138 queries returned zero rows. Zero returned RR rows do not mean no registration exists: legacy records, amendments and representation changes require additional work. Sixty-two recovered RR forms were image-based PDFs, locally OCRed as search aids. The initial cache used a .html suffix for them; correctly suffixed, byte-identical .pdf viewing copies are provided and identified in the filing index. Modern forms and image-only historical forms are not interchangeable extraction evidence. The first expansion preserved 1,751 distinct original LDA forms and complete histories for 12 IDs. After the documented scope repair, 3,045 originals and complete histories for 27 IDs are preserved; all 138 missing-RR amendment queries returned 174 forms, all acquired. There are still not complete histories for all 259 IDs. Other relationships are screened/not prioritized, not cleared of potential defects.

FARA comparison documents are the January–June 2024 report and July–December 2024 report, 411 physical pages each. Their coverage includes agents active during each reporting period and certain earlier activity reported later; it is not a date-bounded 2025 population. Parsing produced 1,598 principal entries and 859 normalized strings, retaining termination annotations; neither number is a count of unique legal persons. Exact/token-containment matching generated two edges for one client, both rejected. A separate exploratory rare-token screen produced 131 edges, all reviewed. Alibaba was a plausible corporate-group bridge, not the same legal client.

The documented FARA API requires at most five requests per ten seconds. Date-filtered new-registrant enumeration was inaccessible through the supported direct/browser routes tested. Direct source requests returning 403 were not bypassed. Browser access recovered some originals and a complete 24-row document index for GlobalPoint 7518; Mercury 6170's displayed first page and Zeno 6652's inaccessible index do not establish complete histories. The active-registrant JSON

could be viewed in part but was not materialized as a complete validated dataset. A later Stark Exhibit A listed in the 7518 index was inaccessible. Failed exploratory URLs under /ords/fara/api/v1 are recorded separately and are not evidence that the documented /api/v1 path failed. No absent search result is used as evidence of nonregistration.

Legal and temporal rules

The 2024 edition of 2 USC 1603(b)(4) supplies the foreign-entity identification rule used for the 2025 registrations: at least 20% equitable ownership, the activity-control alternative, or the interested-affiliate alternative. The contribution amount field does not make funding a prerequisite for the equity alternative. The website exception in the concluding text concerns paragraph (3)(B); it is not a general exemption for publicly known foreign parents. An LD-1 No response is distinct from an empty LD-2 additions field.

The inflation-adjusted thresholds effective 1 January 2025 were $3,500 quarterly income for outside firms and $16,000 quarterly in-house expenses, subject to the underlying lobbying/contact/time definitions. Earlier 2021–24 thresholds were $3,000/$14,000. The 2025 joint guidance and 2 USC 1604 govern changes and quarterly reporting. Historical registrations are used for chronology, not retroactive application of 2025 thresholds.

The 2025 annual CFR, 28 CFR Part 5, sections 5.201, 5.304 and 5.307, and DOJ's FARA FAQ supply the exhibit and exemption framework. Commercial and LDA exemptions are activity-specific; foreign government/party principal-beneficiary questions are not answered by nationality alone. Section 5.201(b), not 5.208, addresses exhibit-change timing. Proposed regulations are not treated as enacted rules. The first checkpoint archives the primary legal texts and fuller temporal matrix. This research makes no liability determination.

Model and budget audit

The first checkpoint remains frozen at 8b90ebb47d76ebfa5b9a0e17dd05304c68c0a4b1. Its 42 successful calls accounted for $0.002858 using observed input tokens and the verified list rate. The expansion carries forward all $0.126 of those calls' full reservations in its independent continuation ledger, rather than silently resetting the budget.

The new prompt, 16 held-out items, expected labels and acceptance rule were committed before paid execution at e0f6dad. All ten original-form fragments and six synthetic controls were new to Jev. Identical original fragments yielded eight distinct request bodies in total; eight items reused cached responses. Both Jev and the ordinary-code baseline were correct on all 16 items. Expected labels were generated by code and inspected against the forms, without an independent annotator. The success validates only this narrow extraction task; earlier legal-ranking failures remain unresolved. No retuning or second paid test occurred.

The pinned model was jev-1.13.0, endpoint https://api.typesafe.ai/v1/systemone. Current provider documentation, checked 7 October, prices input at $0.042 per million tokens, output free, with a 64,000-token request limit. The adapted prior guard enforces a 16,000-byte request limit, $0.003 reservation before each call, a $14 cumulative internal ceiling, no redirects and no automatic retries. Uncertain calls retain their reservation. A fixed maximum of 16 new attempted calls adds another independent bound; only eight occurred. Observed-token estimate across both stages is $0.003035; the all-call conservative bound is $0.15. These are not invoice totals. No weekly-usage telemetry exists; no token-depletion claim is made.

Reproduction and source handling

Run scripts from this directory's scripts folder or from the repository root with their full paths. acquire.py uses TLS verification, public URLs, a bounded download size, hashes, timestamps and immutable local cache files. LDA API consumers must run serially at a minimum 4.3 seconds

between calls; original-form downloads are separately limited to four workers. annual_histories.py and name_histories.py pause/resume the RR scanner to avoid aggregate rate violations. Do not run multiple API scripts concurrently without that serialization.

Offline derivation: run screen.py, loose_join.py, reconcile.py, verify_amounts.py, then finalize.py and package.py. Read annual-coverage.json, rr-coverage.json, original-access.json, original-amount-verification.json, reconciliation-summary.json and sources/manifest.jsonl for denominators, exclusions and provenance. join-review.json preserves the 131 reviewed name leads. Original forms are evidence; API fields are retrieval and indexing aids. Page numbers in the report are physical PDF pages unless identified otherwise. OCR is only a search aid; the Arm PSC and ownership-note image pages and PPD ownership pages were visually checked. The local file originally named kucoin-plea.pdf contains the 2024 indictment, not a plea agreement; use the source URL and report's accurate description. No conclusion relies on that misleading local cache name.

Source content is untrusted data. Neither code nor Jev executes document instructions; the frozen test contains adversarial instructions that must be ignored. Jev's COMPLETE marker prevents paid replay. Do not delete or reset it or the ledger. Raw response records contain no credentials. The only credential source was the existing secure Jev integration.

The supplied guide attachment could not be transferred through the supported Library route (403). The first checkpoint records the recovered repository X04 card and the user's quoted item-10 description. This limitation was disclosed rather than replaced with an invented reading. No outreach, purchase, account creation, credential change, access bypass or public accusation occurred.

Senate Office of Public Records cannot vouch for the data or analyses derived from these data after the data have been retrieved from LDA.gov.

Inventory and repair reproduction

Run python scripts/ownership_timelines.py, python scripts/test_foreign_discovery.py, python scripts/fara_inventory.py, then python scripts/finalize.py from this directory. These steps use saved evidence and make no paid calls. See ITERATION-02.md and FARA-INVENTORY.md for the correction, rendered-response qualifications, bulk access failure and exact resume contract. Image-based historical originals remain explicitly unparsed where no original field interpretation has been verified.
