One project. Two governments. One set of facts.

Ten evidence-tested mining-project pairings for detecting company statements that cannot both be true.

The source hunt succeeded: both sides of all ten candidates were retrieved, opened and matched to the named company or project. These are immediately usable investigative starting points, not ten proven false statements. Several have consistent control values; others need a specific definition or scope question resolved before automated verdicts.

10 pairings across 10 host jurisdictions · 88 direct access tests, 85 HTTP 200 responses · 3 Western access systems tested.

Rank	Project / host country	First fact to compare
1	Kinross - Paracatu tailings facilities / Brazil	Dam construction, liners and stored material
2	Southern Copper - Toquepala and Cuajone / Peru	Annual molybdenum production, with copper as a later extension
3	Endeavour Mining - Ity complex / Cote d'Ivoire	Mining royalties and state-related dividends
4	Endeavour Mining - Sabodala-Massawa / Senegal	Mining royalties and cash dividends to the state
5	B2Gold - Fekola / Mali	Royalties, state dividends and the scope of amended disclosures
6	Rio Tinto - QIT Madagascar Minerals (QMM) / Madagascar	Mining royalty payments, including the local share
7	Barrick / AngloGold Ashanti - Kibali / Democratic Republic of Congo	Dated ownership percentages and shareholder identities
8	IAMGOLD - Essakane / Burkina Faso	Company-declared equity ownership
9	Barrick - Lumwana / Zambia	Mineral royalty and corporate-income-tax payments
10	Galiano Gold - Asanko Gold Mine / Ghana	Mining royalties declared through two reporting systems

Priority reflects a mixture of clean logic, public importance and accessible evidence, not a forecast of wrongdoing. Start the extraction pilot with Peru molybdenum, Brazil dam attributes and Ity royalties.

The free access routes that actually worked

United States: SEC submissions API + bulk filing index

A real submissions JSON response was fetched for Freeport and Rio Tinto, plus SEC-hosted 10-K, AIF and technical-report exhibits. The Q1 2024 master.gz bulk index downloaded successfully (4.49 MB). The index identifies filings; project claims still require extracting the underlying HTML/PDF. Companyfacts is not a substitute for those narrative tables.

SEC API sample · Bulk quarterly index

Canada: government bulk ESTMA index + original returns

Statistics Canada's CSV downloaded in full: 53.26 MB and 114,594 records. It includes entity, payee/project, payment category, reporting-period dates and the original-report link. The sample has year labels 2021-2026; that does not imply complete coverage for every company or year. Use the actual start/end dates. Values are converted to CAD and parent data may also appear for subsidiaries; do not sum duplicated group rows.

Download the tested Canada CSV · Original B2Gold, Barrick, Endeavour and Galiano returns were independently downloaded and inspected.

United Kingdom: Companies House extractives JSON

The unauthenticated all-company 2024 endpoint returned 52 reports. Rio Tinto's company endpoint returned reporting years 2015-2025, including multiple historical versions. A direct 2023 endpoint returned QMM's project royalty. Inspect reportEndDate and version in the response; never infer the period solely from a URL or filing date.

Bulk 2024 JSON · Rio all years and versions · API documentation

Host jurisdictions: prefer national annexes to summary APIs

Brazil provides a full operator-level dam CSV; Peru a company-production XLSX. Burkina Faso, DRC, Cote d'Ivoire, Senegal and Mali supply national Excel annexes. Ghana, Zambia and Madagascar provide downloadable reconciliation PDFs containing named company declarations. These are bulk document downloads, not necessarily query APIs.

The EITI API itself returned country metadata, Senegal summary data and an individual revenue record. But an API field labelled "company" can mean government revenue broken down by company: the inspected DRC summary template explicitly instructs use of government figures. It cannot automatically serve as the second company declaration.

What counts as a government representation here

Eight host-side pairings use returns to national, state-led EITI processes, often compiled by independent administrators. They expose company assertions to the national reporting process. They are not all proven to be legally compulsory regulatory filings. Brazil and Peru are the strictest direct-regulator examples. Legal consequences require a separate jurisdiction-specific assessment.

RAB-MIN-01 / PRIORITY 1 / BRAZIL

Kinross - Paracatu tailings facilities

Dam construction, liners and stored material
SEC effective date 31 December 2025; ANM snapshot retrieved 12 October 2026

Two attributable statements

The operator supplies SIGBM dam records to Brazil's mining regulator, ANM. Kinross files its technical report as an SEC exhibit.

Join keys: Kinross Brasil Mineracao S/A; CNPJ 20346524000146; ANM dam IDs 8438 (Tank XII), 8431 (Eustaquio), 8433 (Santo Antonio). Match individual dams, not just Paracatu.

Evidence inspected

SEC technical report section 18.4, printed pp. 158-159, describes Specific Tailings Tank XII as having downstream raises and a geomembrane liner. ANM row ID 8438 reports "Alteamento a jusante" and liner "Sim". The bulk file contains 906 dam rows; six belong to the selected Kinross operator.

The if/then test

IF two company declarations describe the same dam, same construction stage and same effective time, AND one asserts a mutually exclusive construction method or liner status, THEN those assertions cannot both be correct.

Do this first; reject these false positives

Extract the three named dams first, then all six Kinross structures. Approve a Portuguese-English construction-method dictionary and freeze dated snapshots. The downstream/liner specimen is consistent; it is a useful extraction control, not a misconduct finding.

The SEC report is historical and the ANM file is current. Begin with historical design attributes and confirm no intervening modification; obtain a dated host snapshot for changing attributes. Translate modified centreline as a subtype, not as a contradiction of centreline. Current height is not the same fact as maximum licensed design height. Do not infer safety from a construction label.

Why a surviving mismatch matters

An irreconcilable declaration about tailings engineering could affect downstream communities, safety oversight and investor disclosure. This is the strongest non-financial family in the search.

Readiness: Download and entity match verified; historical-stage alignment required before automatic contradiction flags.

Western: kinross-paracatu-2026.html - HTTP 200; 2.55 MB
Host: brazil-dams.csv - HTTP 200; 3.38 MB

RAB-MIN-02 / PRIORITY 2 / PERU

Southern Copper - Toquepala and Cuajone

Annual molybdenum production, with copper as a later extension
Calendar 2024

Two attributable statements

Southern Copper reports mine production in its SEC 10-K. MINEM publishes company-level data compiled through the ministry's mining-statistics reporting system; monthly ESTAMIN declarations are compulsory.

Join keys: Southern Peru Copper Corporation, Sucursal del Peru; Toquepala plus Cuajone. The ministry row is a company aggregate, so add both mines on the SEC side.

Evidence inspected

MINEM workbook, sheet "2. PRODUCCIÓN EMPRESAS", F72: 13,386.3420761 fine metric tonnes of molybdenum. SEC 10-K production table, printed p. 37: Toquepala 19,771 and Cuajone 9,740 thousand pounds. Their sum converts to 13,385.96443107 tonnes, consistent within the two rows' combined rounding interval of +/-0.45359237 tonnes.

The if/then test

IF the same annual fine-metal output is reported for the same two mines at 100% scope, AND converted precision intervals do not overlap after revisions and measurement conventions are aligned, THEN the two final output assertions are incompatible.

Do this first; reject these false positives

Implement molybdenum for 2023-2024 first using the already downloaded two-year ministry table and SEC history. The 2024 specimen is a positive control. Copper should wait for a documented basis crosswalk; an apparent copper difference is not yet a contradiction.

Separate output from sales, concentrate weight from contained metal, and mine production from smelted/refined metal. Use the latest revisions to the same year. Exclude estimates or provisional measurements from a literal exact-fact test. Do not reuse the production denominator in cash-cost calculations: the 10-K separately identifies one as net of metallurgical losses.

Why a surviving mismatch matters

A material conflict in declared output bears on the production and royalty base of major copper-molybdenum operations. The national workbook permits expansion to other producers once each metal definition is checked.

Readiness: Both sources and a numerical control verified; final-versus-provisional status remains a gate for any future flag.

Western: southern-sec-2024.html - HTTP 200; 10.32 MB
Host: peru-dec2024.xlsx - HTTP 200; 0.34 MB

RAB-MIN-03 / PRIORITY 3 / COTE D'IVOIRE

Endeavour Mining - Ity complex

Mining royalties and state-related dividends
Calendar 2024

Two attributable statements

Endeavour's Canadian ESTMA return is government-indexed. The national EITI workbook separately identifies the extractive company's initial, adjusted and final declarations.

Join keys: Ity complex: Societe des Mines d'Ity (SMI), Societe des Mines de Daapleu (SMD) and Societe des Mines de Floleu (SMF). SMI tax identifier 8500064P; do not compare SMI alone with the whole complex.

Evidence inspected

Host sheets 34.1, 34.5 and 34.8: company-final column G, rows 27 and 42, records the 85% and 15% royalty components. Their sum is XOF 27,368,514,903. ESTMA reports Ity royalties of USD 45,145,203. The disclosed payment-date FX range, XOF 595.72-631.40 per USD, puts the host sum within USD 43.346m-45.942m: no contradiction from this specimen.

The if/then test

IF the approved Ity entity set and the complete royalty basket cover the same 2024 payments, AND the Western USD amount falls outside the host amount's valid FX-and-rounding interval, THEN the payment declarations cannot both describe that same basket.

Do this first; reject these false positives

Use the six royalty cells as the first control. Then check state and SODEMI dividends, preserving the company columns. Extend separately to Lafigue, whose Western and host records are present, after checking its own entity map.

Approve the SMI/SMD/SMF-to-complex mapping before activating the rule. Add both royalty components. Treat state dividends and SODEMI dividends separately before aggregation; establish gross/net withholding treatment. Sheet 45.1 includes government-origin records too: its title alone does not prove company authorship.

Why a surviving mismatch matters

The already inspected royalties alone are about USD 45m, and the Western Ity project payment total is USD 265.6m. An unexplained cross-filing conflict would concern substantial public revenue.

Readiness: Both returns and cell-level company attribution verified; project-basket mapping is the remaining activation gate.

Western: endeavour-estma-2024.pdf - HTTP 200; 0.82 MB
Host: ivory-annexes.xlsx - HTTP 200; 5.04 MB
Host: ivory-2024.pdf - HTTP 200; 12.31 MB

RAB-MIN-04 / PRIORITY 4 / SENEGAL

Endeavour Mining - Sabodala-Massawa

Mining royalties and cash dividends to the state
Calendar 2024

Two attributable statements

Canadian ESTMA return versus company-declared amounts in Senegal's national EITI reconciliation workbook.

Join keys: Sabodala Gold Operations (SGO) and Sabodala Mining Company (SMC) must be distinguished. The Western project is labelled Sabodala Mining Company SARL; the material host payment rows are SGO.

Evidence inspected

Host sheet 11, I33: SGO company-final mining royalty XOF 12,982,245,458; I38: state dividends XOF 8,550,085,532. ESTMA project royalties are USD 21,399,746. The disclosed FX range yields USD 20.561m-21.793m for the host royalty, which contains the Western amount.

The if/then test

IF the project/subsidiary bridge is established and both returns describe the same recipient, payment category and cash year, AND the permissible monetary intervals are disjoint, THEN the paired claims are incompatible.

Do this first; reject these false positives

Approve the SGO/SMC bridge, then compare royalties first. Preserve G/H/I and J/K/L to show original statements and amendments. Only after that activate dividends and other precisely matched payments.

Never join solely on the word Sabodala: SGO and SMC are different legal entities. Use column I for the company, not L for government. The initial government royalty is XOF 16.602bn and was adjusted down; that domestic reconciliation is already public. Dividend gross/net treatment needs separate checking.

Why a surviving mismatch matters

The Western project reports USD 207.6m in 2024 payments. A material false representation to either reporting system would be consequential for public revenue and investor disclosure.

Readiness: Both returns and company cells verified; legal-entity/project bridge required, with a consistent royalty control.

Western: endeavour-estma-2024.pdf - HTTP 200; 0.82 MB
Host: senegal-extra.xlsx - HTTP 200; 18.45 MB
Host: senegal-2024.pdf - HTTP 200; 13.58 MB

RAB-MIN-05 / PRIORITY 5 / MALI

B2Gold - Fekola

Royalties, state dividends and the scope of amended disclosures
Calendar 2023; 2024 host annexes also downloaded

Two attributable statements

B2Gold's amended Canadian ESTMA return versus Fekola's own declaration in the national EITI reconciliation schedule.

Join keys: Fekola SA; NIF 087800848K. Keep the Fekola mine separate from the Western report's Fekola Regional exploration/development project.

Evidence inspected

Host sheet "Annexe 10 - (2)": I6 tax ad valorem XOF 22,844,482,528; I13 ISCP XOF 22,873,818,742; I7 dividends XOF 32,135,608,890. Column I is company-after-adjustments. ESTMA Fekola reports royalties USD 75.69m and dividends USD 59.06m, within total payments USD 336.31m.

The if/then test

IF the same dividend or complete royalty payment basket is asserted for 2023, with free-carried versus ordinary equity dividends and gross/net tax treatment aligned, AND even the full disclosed FX range cannot reconcile it, THEN at least one underlying amount is incorrect.

Do this first; reject these false positives

Resolve the dividend gross/net and entitlement definitions first; the required documents are already in hand. Retain the amended ESTMA version 2 and its amendment note. The 2024 host annex is also available for a follow-on year once its Western counterpart is retrieved.

Do not compare ESTMA royalties with the ad-valorem tax alone: determine whether ISCP belongs in the same basket. The dividend alone converts to USD 51.211m-55.071m using the report's CFA-to-USD bounds, below USD 59.06m; this is a review lead, not an established contradiction. Withholding, equity entitlement and cash scope could explain it.

Why a surviving mismatch matters

A large payment claim concerning a state shareholding and a major gold operation gives a concrete public-interest question. The available numbers support a targeted document request if their definitions remain unclear.

Readiness: Both declarations and exact cells verified; a numerical review lead exists, but no company wrongdoing is established.

Western: b2gold-estma-2023.pdf - HTTP 200; 0.51 MB
Host: mali-annexes-2023.xlsx - HTTP 200; 0.76 MB
Host: mali-2023.pdf - HTTP 200; 3.75 MB

Rio Tinto - QIT Madagascar Minerals (QMM)

Mining royalty payments, including the local share
Calendar 2023

Two attributable statements

Direct Companies House JSON of Rio Tinto's payment report, corroborated by an FCA-hosted filing, versus QMM's company return published by EITI Madagascar.

Join keys: Rio Tinto plc, UK company 00719885; project code MDG01. QMM tax identifier 4000164665; RCS 1998B00480 (host annex PDF p. 15).

Evidence inspected

UK JSON projectPayments/projectPayment: MDG01 Royalties USD 3,527,727. Host report PDF p. 264, table 109: QMM declares MGA 4,747,768,340.47 mining royalty plus MGA 11,078,126,125.81 local mining royalty share to the Fort-Dauphin treasury. The table explicitly attributes its source to companies' reporting templates.

The if/then test

IF those two Malagasy components exhaust the royalty basket reported in MDG01, AND payment-date currency conversion, timing and refund treatment cannot reconcile their sum with the UK amount, THEN the declarations conflict.

Do this first; reject these false positives

Start with the royalty basket and obtain/derive legitimate payment-date FX bounds. Then expand across years using the UK company endpoint, which returned reports for 2015-2025 and preserves versions. The all-company 2024 endpoint returned 52 reports.

Use company declarations on p. 264, not the government-derived theoretical allocation on p. 259. Translate ristourne miniere as a local royalty share, not automatically as a refund. Do not treat promised project contributions on p. 214 as paid cash without checking the conditional wording. A single average exchange rate cannot establish a contradiction.

Why a surviving mismatch matters

This joins public revenues from a coastal mineral-sands project with a major multinational's UK filing; the local royalty share connects directly to community benefits.

Readiness: Direct government API and host company statement verified; royalty-basket and FX validation still required.

Western: uk-rio-2023.json - HTTP 200; 0.03 MB
Western: rio-fca-payments-2023.html - HTTP 200; 0.22 MB
Host: madagascar-2023.pdf - HTTP 200; 9.74 MB
Host: madagascar-annexes-2023.pdf - HTTP 200; 56.37 MB

Barrick / AngloGold Ashanti - Kibali

Dated ownership percentages and shareholder identities
2023 reporting year

Two attributable statements

Barrick's SEC-filed Annual Information Form versus Kibali's capital-structure declaration to the DRC national EITI process.

Join keys: Kibali Goldmines SA, NIF A0702049L; Barrick 45%, AngloGold Ashanti 45%, SOKIMO 10%. Match shareholder interests at the same corporate level.

Evidence inspected

Host sheet "Annexe 11 " (trailing space), row 29: C29 says the company supplied its declaration; F29 is the tax ID, I29 records SOKIMO 10, N29 Barrick 45; the following row continues the other shareholder. "Annexe 13 " records the company's statement that Barrick and AngloGold each control 45%. Barrick's 2023 AIF reports a 45% interest.

The if/then test

IF two company statements describe the same class of shares or economic interest at the same company level and date, AND the named holder's percentages are mutually incompatible, THEN both cannot be correct.

Do this first; reject these false positives

Use Kibali's 45/45/10 split as the first control; add AngloGold's SEC report as a third independent regulatory filing. Then map other DRC operators with an affirmative company-submission marker to listed Western parents.

Do not equate a direct holding-company share with a parent's effective economic interest. Track acquisition dates and share classes. Silence on a beneficial owner is not a contradictory denial. Kamoa was rejected for this ownership pilot because the same host table marks its capital declaration as not supplied.

Why a surviving mismatch matters

An ownership conflict could affect entitlement to profits, state participation and identification of the party responsible for a major gold operation. It avoids foreign-exchange ambiguity.

Readiness: Host company authorship and Western interest verified; same-date and same-level ownership checks remain mandatory.

Western: barrick-sec-aif-2023.html - HTTP 200; 1.92 MB
Host: congo-annexes.xlsx - HTTP 200; 7.32 MB
Host: congo-2023.pdf - HTTP 200; 4.23 MB

IAMGOLD - Essakane

Company-declared equity ownership; production as a second-stage check
Capital snapshot labelled 31 December 2023 inside the 2024 host return

Two attributable statements

IAMGOLD's SEC-filed AIF versus an embedded company capital-structure form in Burkina Faso's national EITI workbook.

Join keys: Iamgold Essakane SA, host tax identifier 00016079H. Annexe 10 row 9 identifies its supplied legal-ownership data; the embedded object is anchored to that row.

Evidence inspected

Inside the XLSX ZIP: xl/embeddings/Microsoft_Excel_Worksheet3.xlsx, sheet "17.Structure de Capital ". D13 is 0.10 state participation; C15 identifies IAMGOLD and D15 is 0.90. The Western AIF reports IAMGOLD 90% and state 10%. The form includes a management-attestation section. Its capital-date label is 2023 despite a 2024 reporting-period header.

The if/then test

IF the date label is resolved and two declarations assert different ownership fractions for the same shareholding at the same date, THEN both cannot be correct. A later ownership change cannot make the earlier statement contradictory.

Do this first; reject these false positives

Build the 90/10 ownership control, then extract other embedded capital forms. For the production branch, distinguish fine gold, dore, sales and attributable output; never call the raw kilogram/ounce difference a proven false statement.

Preserve the embedded document and the workbook relationship linking it to row 9. Do not silently change the date to 2024. Production is promising but not yet semantically aligned: company volume in Annexe 6 E18 is 14,603.158 kg, while the SEC 2024 table reports 454,000 ounces at 100% scope. Gold purity, inventory and production definitions must be settled first.

Why a surviving mismatch matters

State equity determines public participation in profits. The embedded forms are a particularly useful corpus of attributable company representations that flat table scrapers can miss.

Readiness: Original embedded form, parent filing and provenance anchor verified; explicit date ambiguity is quarantined.

Western: iamgold-sec-aif-2023.html - HTTP 200; 1.05 MB
Western: iamgold-sec-2024.html - HTTP 200; 2.03 MB
Host: burkina-annexes.xlsx - HTTP 200; 17.36 MB
Host: burkina-2024.pdf - HTTP 200; 2.30 MB

Barrick - Lumwana

Mineral royalty and corporate-income-tax payments
Calendar 2023; use the 2023 reconciliation in the combined 2023-2024 report

Two attributable statements

Barrick's Canadian ESTMA return versus Lumwana's company column in the Zambia EITI reconciliation.

Join keys: Lumwana Mining Company; 100% project scope. Keep Kansanshi and its distinct ZCCM royalty arrangement outside this pilot.

Evidence inspected

ESTMA project table: Lumwana royalties USD 66,410,000 and taxes USD 7,620,000. Host PDF physical p. 119 (printed p. 117): company-declared mineral royalty ZMW 1,295,435,702.84 and income tax ZMW 157,681,355.48, alongside government amounts and reconciliation notes.

The if/then test

IF the two declarations concern the same cash-paid mineral royalty or income tax for 2023, AND validated FX, refunds, offsets and amendments cannot reconcile them, THEN they cannot both be accurate descriptions of those payments.

Do this first; reject these false positives

Begin with the two company-column fields. Check amended amounts and establish legitimate FX bounds before running annual comparisons. Broaden to Kansanshi only after separating statutory mineral royalty from payments to ZCCM-IH.

The host report already explains duplicated government records and earlier-year amounts paid in 2023. Preserve that reconciliation; do not present it as a new discovery. A payment year differs from a liability year. The Western average ZMW/USD rate is contextual, not a permissible substitute for transaction-date conversion. Do not mix cash payments and VAT offsets.

Why a surviving mismatch matters

The sample royalty is USD 66.4m on the Western side. A surviving conflict would bear on state revenue from a major copper project, rather than merely on a minor reporting line.

Readiness: Both disclosures and the exact company column verified; reconciliation, cash-basis and currency gates are unresolved.

Western: barrick-estma-2023.pdf - HTTP 200; 0.26 MB
Host: zambia-2023-2024.pdf - HTTP 200; 3.41 MB

RAB-MIN-10 / PRIORITY 10 / GHANA

Galiano Gold - Asanko Gold Mine

Mining royalties declared through two reporting systems
Calendar 2023

Two attributable statements

Galiano's Canadian ESTMA return versus Asanko Gold Mines Ltd's own payment figures in Ghana's EITI reconciliation appendix.

Join keys: Asanko Gold Mines Ltd; TIN C0004524764. Join the operating project, not merely the Galiano parent or its historical equity percentage.

Evidence inspected

ESTMA project table reports Asanko royalties of USD 14,802,000. Host Appendix 3D begins at PDF p. 250; p. 251 gives company-final mineral royalty GHS 142,780,548. It separately shows a government adjustment of GHS 11,606,054. The Western return supplies currency-conversion notes and rounds to USD 1,000.

The if/then test

IF project scope, included royalty recipients and cash-year definitions are identical, AND the permitted conversion and rounding intervals do not overlap, THEN the two royalty declarations conflict.

Do this first; reject these false positives

Use the stated TIN and Appendix 3D to anchor extraction. Compare royalty components and their currency notes first; retain the company-final figure and original declaration separately. Expansion can reuse the same national reconciliation appendix for other Western-listed gold producers.

Do not apply the parent's ownership percentage to a project-wide payment number. Galiano's corporate withholding-tax line is a different project line. Read category-specific currency notes; some payments may already be in USD. Exclude the domestic government adjustment from any claim of a newly found cross-government mismatch.

Why a surviving mismatch matters

This is a roughly USD 15m royalty claim in a producing gold mine. The English-language pair is a useful baseline to validate the financial rules before applying translated versions elsewhere.

Readiness: Both sources and company attribution verified; payment-currency and project-wide scope must be documented before a verdict.

Western: galiano-estma-2023.pdf - HTTP 200; 0.44 MB
Host: ghana-2023.pdf - HTTP 200; 5.20 MB

Turn a mismatch into a logical contradiction

The strict test is a conditional one: once two statements are verified to concern the same fact, their allowed values must have no overlap. The system can establish incompatibility without choosing which statement is true. A different number by itself does not establish that condition.

Required alignment	What the system must retain
Speaker and recipient	Company-original statement, filing/submission identity, host publication provenance. A compiler or translation error is not proof the company made the false claim.
Entity and project	Operator ID, parent/subsidiary bridge, project components, recipient and share class where relevant.
Time and version	Covered period, effective date, submission date, revision date, initial declaration and reconciled replacement.
Definition and scope	Fine metal vs concentrate; 100% vs attributable; legal vs economic ownership; paid vs owed; gross vs net; offsets and refunds.
Precision and currency	Original units, rounding increments, actual transaction rates or defensible bounds. Never use a guessed tolerance or annual-average FX as proof.
Completeness	Blank, non-response, below-threshold and omitted fields remain unknown, not zero.

A particularly useful currency rule

For positive payments in one local currency, with local total L and known payment-date rates between r_min and r_max local units per USD, the USD total must lie in [L/r_max, L/r_min]. Add only documented rounding uncertainty. With mixed currencies, refunds or offsets, derive bounds component by component instead.

Actual calibration from this research

Ity royalties fall inside the FX interval; Senegal royalties also fall inside it. Southern Copper's molybdenum values overlap within the published table precision. Those controls demonstrate usable joins, not truth. Fekola's dividend arithmetic does not overlap before definition adjustments, so it is held for review rather than labelled false.

Output language

Return COMPATIBLE WITH PRECISION, REVIEW REQUIRED, or INCOMPATIBLE CLAIMS. Only the last requires every alignment gate to be satisfied. Even then the conclusion is "these verified assertions cannot both be correct"; it does not establish deliberate lying, criminal conduct or which regulator received the wrong figure.

Use AI for language and extraction, not the verdict

Retain the original-language span, page/cell, company attribution, table headers and footnotes beside every extracted claim. Ask the model to produce a literal translation plus a structured record; have a reviewer approve each new document template and each new category mapping. Then run deterministic arithmetic and set comparisons.

Source term	Working meaning / caution
Paiements Entreprises / Societes	Company-declared payments. Distinguish initial, adjustments and final.
Paiements Regies / Gouvernement	Government-side amounts. Not a second company statement.
Ristourne miniere	Local share of a mining royalty in the Madagascar specimen. Do not automatically translate as a refund or discount.
Taxe ad valorem / ISCP	Distinct payment streams in Mali. A regulatory category crosswalk is required before summing into ESTMA royalties.
Alteamento a jusante	Downstream raising. Match the same dam and construction stage.
Alteamento por linha de centro	Centreline raising. Modified centreline may be a subtype, not an incompatible category.
Dano Potencial Associado	Potential consequence classification. Different from failure probability or the risk category.
TMF	Fine metric tonnes. Do not compare with gross concentrate weight.
Produccion empresas	Production by company. May aggregate several mines.

A compact claim record

Store: company ID; parent; project ID; factual predicate; value and precision; original unit; currency; covered period; effective date; filing version; share/scope basis; gross/net basis; source URL; SHA-256; page/cell; original text; translation; author; recipient; confidence; and unresolved gates.

The supplied comparison kernel

The starter kit includes a small Python kernel that compares already-normalised intervals or mutually exclusive categories. It deliberately refuses to issue an incompatibility result while an alignment gate is unresolved. Four controls were executed successfully, including a synthetic disjoint pair and the quarantined Mali dividend example. This is a starting component, not a finished document crawler or a completed audit of all ten projects.

Where to invest the first work

1. Prove extraction on three different fact types

Use Peru molybdenum for unit conversion and aggregation; Brazil Tank XII for translated categorical assertions; Ity for subsidiary aggregation and bounded FX. Preserve their consistent values as regression controls. Run the first pilot on a few dozen precise claims, then broaden by year and operator.

2. Resolve the three highest-value financial questions

For Fekola, establish dividend gross/net and equity-entitlement treatment before interpreting the non-overlap. For Sabodala, document the SGO/SMC-to-project bridge. For QMM, document the royalty basket and legitimate MGA/USD conversion bounds. Each question is bounded and begins from evidence already downloaded.

3. Use ownership declarations as an independent branch

Kibali and Essakane supply attributable company ownership data. Build date-aware ownership graphs and preserve holding-company layers. The Burkina workbook embeds original forms; the DRC workbook tells you which companies supplied a declaration. Those provenance fields are essential filters.

Routes deliberately not promoted into the ten

Route	Reason / observed test
Mauritania - Tasiast	2024 report PDF p. 60 already explicitly compares the local declaration with Kinross ESTMA. A precedent, not evidence of an unchecked new pairing.
Mongolia - Oyu Tolgoi	National PDFs downloaded, but the live reporting portal returned 502. Detailed royalty appendix is government-side; company totals include broader flows. Insufficient attribution for the desired exact payment test.
DRC - Kamoa payment API	Summary XLSX downloaded, but its company-level amounts are government revenues. The annex points to a separate reconciliation file that was not located; ownership declaration marked not supplied.
Philippines - MGB bulletin	Direct production-bulletin download returned 403. EITI report was accessible, but a stronger, precise company-government match was not established in this session.
EITI bulk company-revenue query	One filtered revenue query returned 403 although an individual revenue record worked. Use national originals; do not claim the bulk query was verified.
Canadian securities bulk access	Do not assume SEDAR+ bulk availability from the Rabbit catalogue. The tested Western securities route here is EDGAR.

These are not assertions that the underlying information is unavailable everywhere. They record why these particular routes failed the selection standard during this research.

Evidence custody and research limits

The kit contains a manifest of 41 selected original downloads, retrieval metadata and hashes, candidate specimens, and 11 machine-readable source snapshots. Full third-party narrative reports are linked rather than reproduced. Every source used in a candidate returned HTTP 200 and was parsed far enough to locate the named project or company. A page title or search snippet alone was not counted as an availability test.

What the archive lets an investigator reproduce

candidates.json contains the full candidate cards and embedded-form provenance. source-manifest.json supplies exact URLs, final redirect URLs, UTC retrieval times, content types, byte counts and SHA-256 hashes. archive_path identifies the snapshots included in the kit; other reports can be fetched using download_filename and the source URL. access-log.jsonl records all direct fetches, including the three failed routes. fetch_sources.py can re-fetch one candidate's documents without overwriting the evidence snapshot.

What this search did not establish

No material cross-government contradiction has been established to publication standard. No company was contacted. Local filing law, admissibility, assurance and attribution to the original submitter remain case-specific. Download access today is not an uptime guarantee, an unrestricted redistribution licence or a promise that every year is complete.

Relationship to yesterday's Rabbit idea

This extends the earlier if/then mechanism and the Rabbit ESTMA source SYS-0295. The crucial refinement is speaker attribution: the host-side comparison must be the company's own representation, not simply government receipts. Existing reconciliation already checks many company-versus-government payment differences; the proposed additional check runs across the company's statements to different national systems.

The assumption about a previously unchecked space

Treat low cross-jurisdiction checking as a hypothesis, not an established fact. Mauritania provides a direct counterexample: its 2024 report discusses matching the local Tasiast declaration to ESTMA. The defensible opportunity is broader coverage, reproducibility, multilingual extraction and logically stricter predicates, rather than claiming nobody has attempted the comparison.
